

To-Do List Manager Python Final Project

Jeffrey Antwi

Command-line task management application demonstrating
Python fundamentals: variables, collections, control flow,
iteration, and user interaction.

What went right.

Dictionary Data Structure

Using dictionaries made the code organized and easy to read.

Modular Function Design

Separate functions for each feature made testing and debugging easier.

Clear Menu Structure

Simple numbered menu made user interaction intuitive.

What Needs Improvement

- No Data Persistence 4 Tasks disappear when program closes 5
Could add file saving to store tasks between sessions
- Limited Error Handling 8 Could add more robust validation for edge cases 9
- No Task Categories 11 Could add tags or categories to organize tasks better.

Risk & Change Management

- Initial Plan: Use separate lists for task names and completion status
- Risk Identified: Parallel lists are harder to maintain and can get out of sync 6
- Change Made: Switched to list of dictionaries 8Each task is one dictionary with description and status keys
- Result: Cleaner data structure, easier to maintain and extend

Actionable Advice

- Start Simple, Build a working prototype first, then add features incrementally
- Test Early and Often Test each function immediately after writing it to catch bugs early
 - Use Version Control

Commit changes regularly to track progress and enable rollbacks
